

# Stripe Marking

**This system places continuous or dashed stripes on a web to indicate web orientation or product type.**

Product alignment or product type identification is critical to many customers, especially when similar material types or grades make visual identification difficult or impossible. A Monarch Stripe Marking System creates continuous or dashed marks for the entire length of a product to indicate product type or a unique characteristic of the material. Marks can represent a specific material grade used in a multi-ply product, filter media orientation, or indicate the coated or uncoated surface of a material. Various marking colors available in the Monarch system can also be used to uniquely identify multiple products on the same manufacturing line.

## Improve Quality and Efficiency

- Providing clear indications of product orientation to downstream processes and end users.
- Not processing a web in the wrong orientation or position in a multilayer product.
- Marking automatically and continuously instead of making marks by hand.
- Reducing time spent determining correct roll orientation while processing.

## Create a safer work Environment by...

- Reducing the reloading of incorrectly oriented rolls on a converting line

Mark Visible on the edge or down lanes of the material.
